

I reviewed the AI-generated code to make sure it implemented the existing NotificationMedium interface exactly as required. I verified that the class used implements NotificationMedium and that the method signature remained public void send(String message). By matching the existing interface instead of changing it, I was able to add WhatsApp functionality without modifying the core AlertSystem. This allowed the new service to be used with the existing setMedium() method and demonstrated the Open-Closed Principle because the system was extended without rewriting existing code.
